What is Trigonometry?

Introduction

- Study of the relationship between the angles in a right triangle with the lengths of the sides
- Basic trigonometry deals mainly with Right Triangles
- There are three basic trigonometry functions:
 - Sine, Cosine, and Tangent [look for them on your calculator]
- These trig. Functions will give you the ratios of the sides in a right triangle

Basic Trig Ratios

Example

For a right triangle with angle 22.62° :

$$\sin 22.62^\circ = \frac{5}{13} \approx 0.38461538\dots$$

$$\cos 22.62^\circ = \frac{12}{13} \approx 0.92307692\dots$$

$$\tan 22.62^\circ = \frac{5}{12} \approx 0.41666666\dots$$

Naming Sides of a Right Triangle

Important Notes

- When naming the sides of a R.T., they are relative to the angle that you are using
- The Adjacent and Opposite side can be switched around depending on which angle you use
- The Hypotenuse must be the longest side and opposite from the "box"
- When using Trig, make sure your calculator is on "DEG" mode

Trigonometric Ratios

$$\sin \theta = \frac{\text{Opposite}}{\text{Hypotenuse}}$$

$$\cos \theta = \frac{\text{Adjacent}}{\text{Hypotenuse}}$$

$$\tan \theta = \frac{\text{Opposite}}{\text{Adjacent}}$$

- Use SINE when working with Opposite or Hypotenuse
- Use COSINE when working with Adjacent or Hypotenuse
- Use TANGENT when working with Opposite or Adjacent

Finding Missing Sides

Steps to Find Missing Sides

- 1 Identify which sides are given (name them based on the angle)
- 2 Determine which trig function to use: SOH - CAH - TOA
- 3 Write the equation and use algebra to find the missing side
- 4 Make sure your calculator is in DEG mode!

Example: Finding Missing Side

Example

Find x :

$$\begin{aligned}\tan 23^\circ &= \frac{12}{x} \\ 0.4244748162 &= \frac{12}{x} \\ x &= \frac{12}{0.4244748162} \\ x &\approx 28.2702\end{aligned}$$

Finding Missing Angles

Important Notes

- Use inverse trig functions: \sin^{-1} , \cos^{-1} , \tan^{-1}
- First determine which sides are given and which trig function to use
- Keep at least 3-4 decimal places for your angles
- You can only "Inverse Tan" a ratio, it gives you the angle

Example: Finding Missing Angle

Example

Find θ :

$$\tan \theta = \frac{12}{15}$$

$$\theta = \tan^{-1} \left(\frac{12}{15} \right)$$

$$\theta \approx 38.6598^\circ$$

Practice: Identify Sides Trig Function - Part 1

Indicate Sides (Opp

Indicate which sides are given: Opp, Adj, or Hyp. Then indicate which trig function should be used to solve the triangle.

Practice: Identify Sides Trig Function - Part 2

Indicate Sides (Opp

Indicate which sides are given: Opp, Adj, or Hyp. Then indicate which trig function should be used to solve the triangle.

Practice: Finding Missing Sides - Part 1

Find the length of the missing sides

Practice: Finding Missing Sides - Part 2

Find the length of the missing sides

Practice: Finding Missing Angles - Part 1

Find the degree of the missing angle

Practice: Finding Missing Angles - Part 2

Find the degree of the missing angle

Pythagorean Theorem

Pythagorean Theorem

- Used to find the missing side lengths of a right triangle when two sides are known.
- Formula: $a^2 + b^2 = c^2$, where a and b are the lengths of the two shorter sides (legs), and c is the length of the longest side (hypotenuse).
- Also used in trigonometry for fundamental identities like $\sin^2 \theta + \cos^2 \theta = 1$.

Challenge Problem

Application of Trigonometry

Two buildings are 70 meters apart. The shorter building is 50m high. A cable is attached to both buildings. The angle of inclination is 15° . How tall is the taller building?
